Supported by DARPA under Grant No: HR0011-08-1-0076

# Outline

- Dynamic Optical Networking: Vision vs. Reality
- Edge Reconfigurable Optical Networks (ERONs)
- ERON Dimensioning
- Simulation Results

# Dynamic Optical Networking

## Vision:

- E2E transparent lightpaths with optical switching
- Hundreds of  $\lambda$ s
- On-demand optical connections
- Highly reconfigurable core networks

# Dynamic Optical Networking

## Vision:

- E2E transparent lightpaths with optical switching
- Hundreds of  $\lambda$ s
- On-demand optical connections
- Highly reconfigurable core networks

## Reality:

- P2P connections with OEO
- Few  $\lambda$ s
- Long-lived, leased lightpaths
- Mostly statically configured core networks

# Dynamic Optical Networking

- Vision: (DARPA CORONET)
  - E2E transparent lightpaths with optical switching
  - Hundreds of  $\lambda$ s
  - On-demand optical connections
  - Highly reconfigurable core networks
- Reality:
  - P2P connections with OEO
  - Few  $\lambda$ s
  - Long-lived, leased lightpaths
  - Mostly statically configured core networks

# Application Requirements vs. Infrastructure Limitations

- Application and Research Collaboration Requirements:
  - Lightpaths across multi-domain networks
  - Distributed coordination of network & network-attached resources
  - Connection establishment/termination based on user requirements

# Application Requirements vs. Infrastructure Limitations

- **Application and Research Collaboration Requirements:**
  - Lightpaths across multi-domain networks
  - Distributed coordination of network & network-attached resources
  - Connection establishment/termination based on user requirements
- **Infrastructure Limitations:**
  - Lack of capabilities for rapid/automatic lightpath establishment
  - High administrative burden → coordinate multiple providers
  - High cost of (semi-)permanent lightpaths

# Static Topologies

- Collection of independent lightpaths; assembled by
  - NRENs
  - academic/research communities
  - large government/private organizations

# Static Topologies

- Collection of independent lightpaths; assembled by
  - NRENs
  - academic/research communities
  - large government/private organizations
- Each lightpath:
  - established on an “as needed basis”
  - dedicated between two end-users
    - high-end devices, instruments, . . .
  - held in place for long time periods ( $>$  months)

# Challenges

- Applications require **sporadic** access to lightpaths
  - extremely low utilization
- Dedicated lightpaths
  - only available to small fraction of potential users

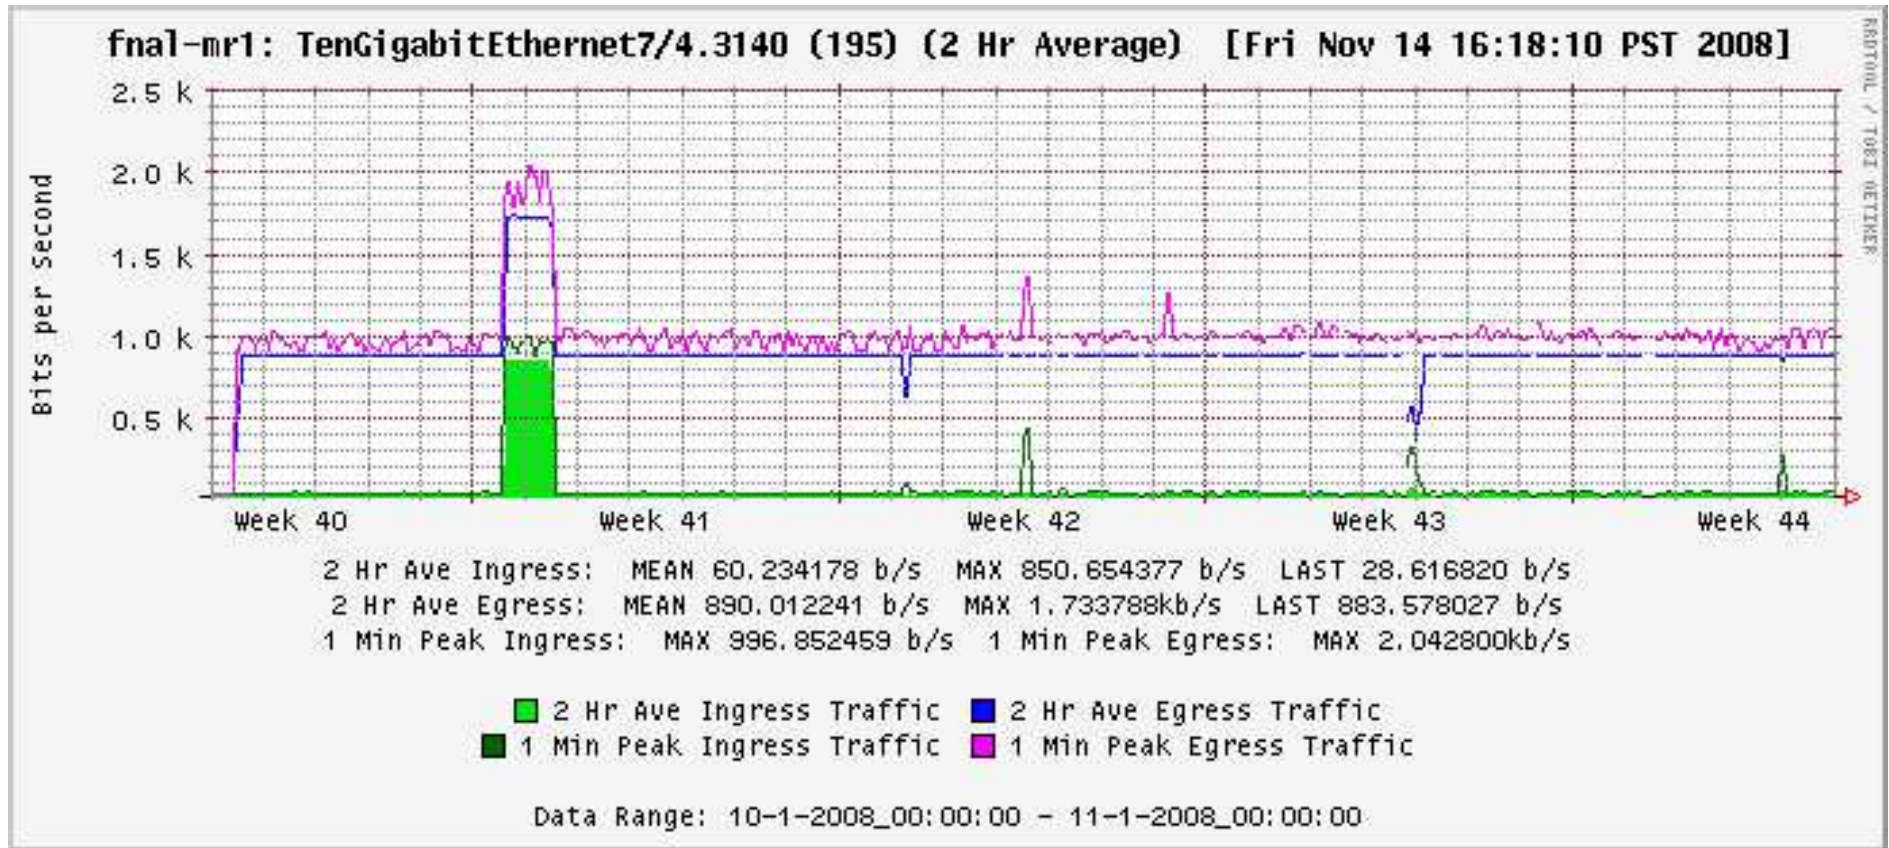

# Utilization (1)

# Utilization (2)

# Utilization (3)

# Edge Reconfigurable Optical Networks

- ERON goal:

transform a set of static optical connections into a flexible network topology that affords users the ability to reserve on demand, or in advance, lightpaths for any desired duration

# Edge Reconfigurable Optical Networks

- ERON goal:
  - transform a set of static optical connections into a flexible network topology that affords users the ability to reserve on demand, or in advance, lightpaths for any desired duration
- Overlay network:
  - optical switching capabilities at **edge nodes**
  - under **user** (not network provider) control

# ERON Components

1. A collection of permanent lightpaths
  - leased, connect organization's sites
  - define static logical topology

# ERON Components

1. A collection of permanent lightpaths
  - leased, connect organization's sites
  - define static logical topology
2. Edge hardware → under user control
  - MEMS optical switches
  - Ethernet switches
  - Short-reach optical interfaces

# ERON Components

1. A collection of permanent lightpaths
  - leased, connect organization's sites
  - define static logical topology
2. Edge hardware → under user control
  - MEMS optical switches
  - Ethernet switches
  - Short-reach optical interfaces
3. Control software → implements control overlay
  - GMPLS signaling
  - resource broker

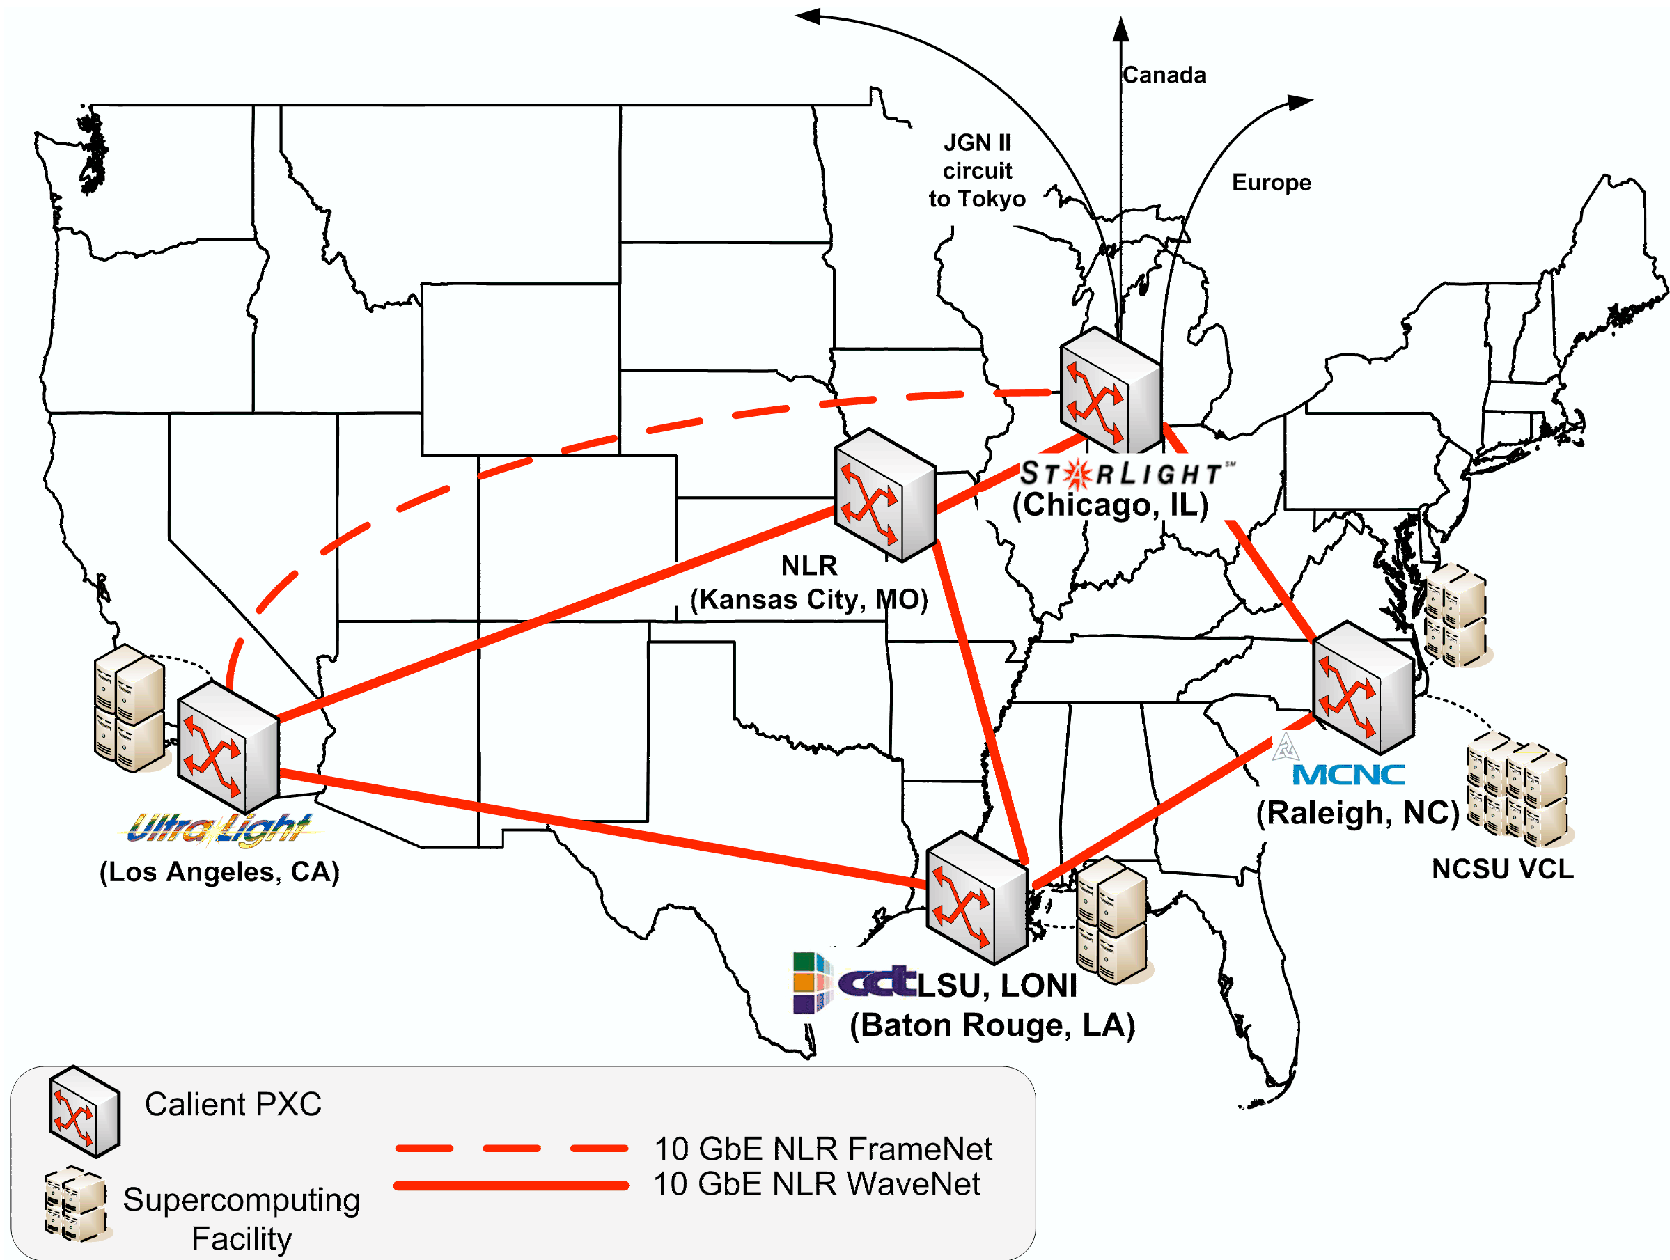

# ERON

# ERON Benefits

- Dynamic connections over static topology
- Multihop connections (transparent to network provider)
- Lightpath sharing among multiple users
- Increased “degree of connectivity”
- Higher utilization
- Amortization of high resource cost over many users/applications

# EnLIGHTened Computing Testbed

# Research Question

- ERON deployment costs:
  - hardware and software expense (one-time, mostly)
  - possibility of blocking

# Research Question

- ERON deployment costs:
  - hardware and software expense (one-time, mostly)
  - possibility of blocking
- Savings?
  - reduced number of lightpaths
  - blocking probability  $\leq 10^{-3}$  → QoS metric

# Research Question

- ERON deployment costs:
  - hardware and software expense (one-time, mostly)
  - possibility of blocking
- Savings?
  - reduced number of lightpaths
  - blocking probability  $\leq 10^{-3}$   $\rightarrow$  QoS metric
- Objective:
  - quantify practically achievable benefits
  - no attempt to find optimal solutions

# ERON Topology Design

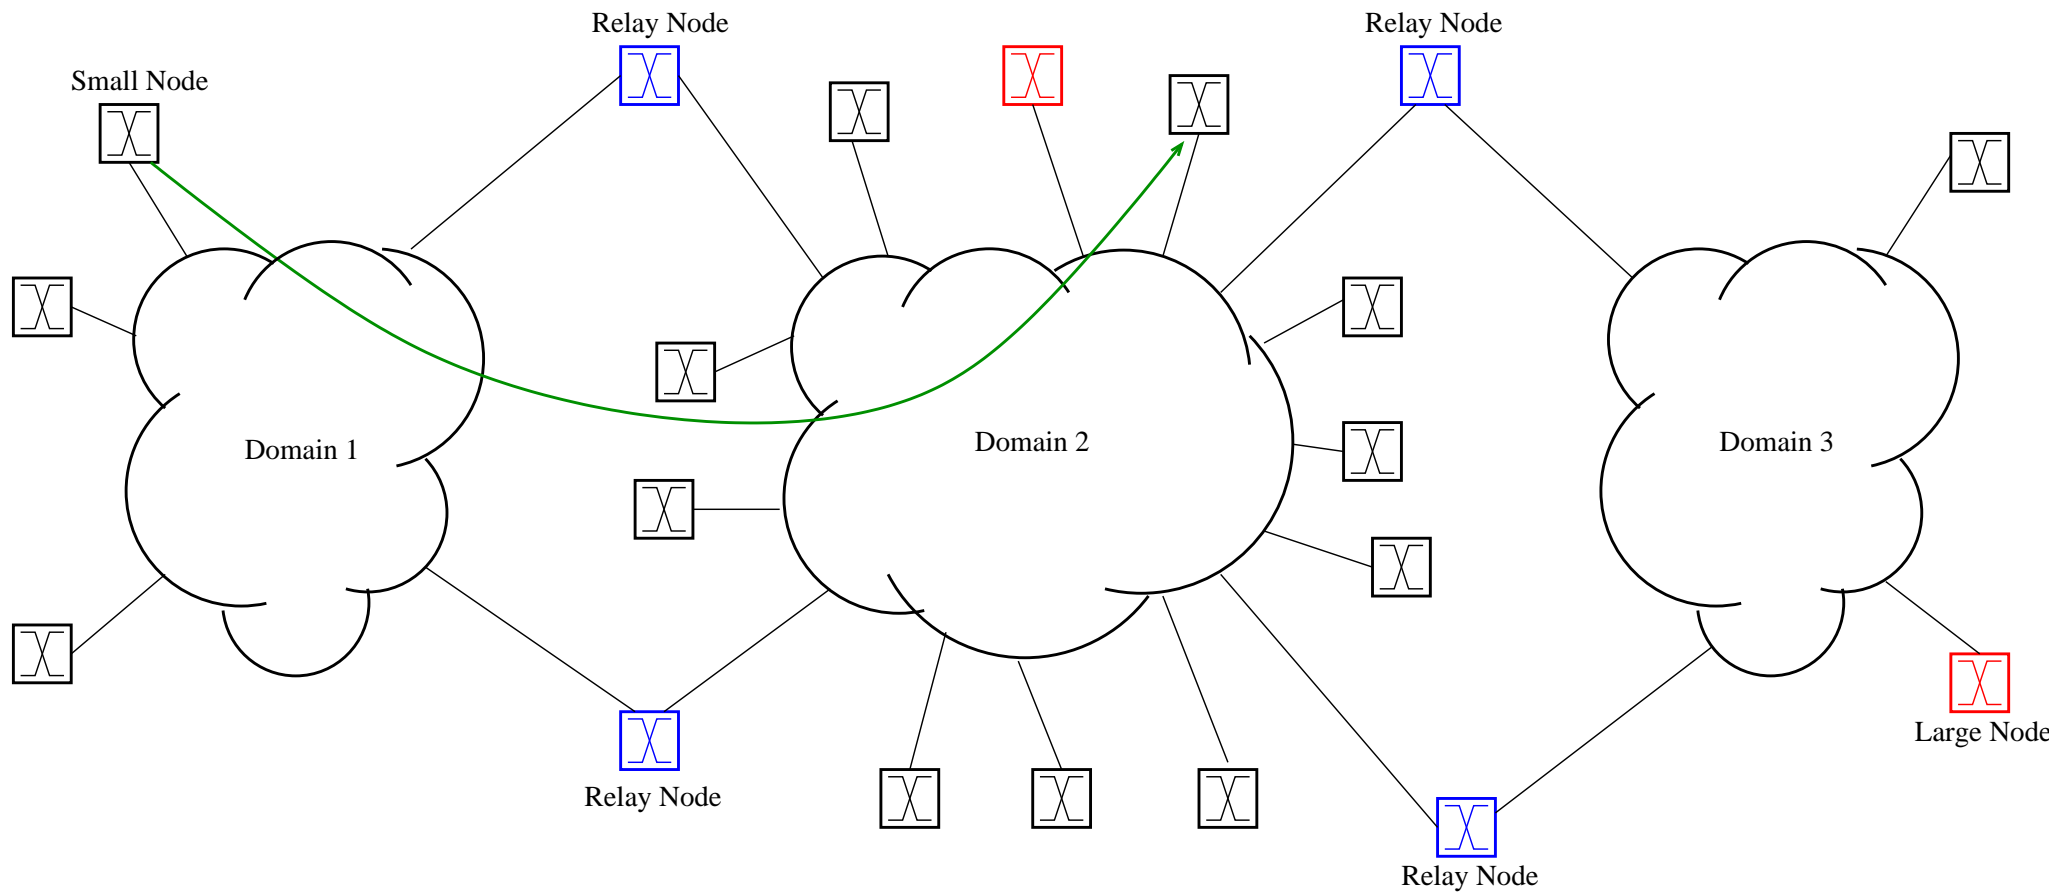

# ERON Topology Design

1. Start with static topology → link capacities
2. Run simulation → link utilizations
3. Consider each link in isolation
  - Erlang-B → target link utilization
4. Reduce capacity of link with smallest relative link utilization
5. Repeat from Step 2 while  $BP < 10^{-3}$

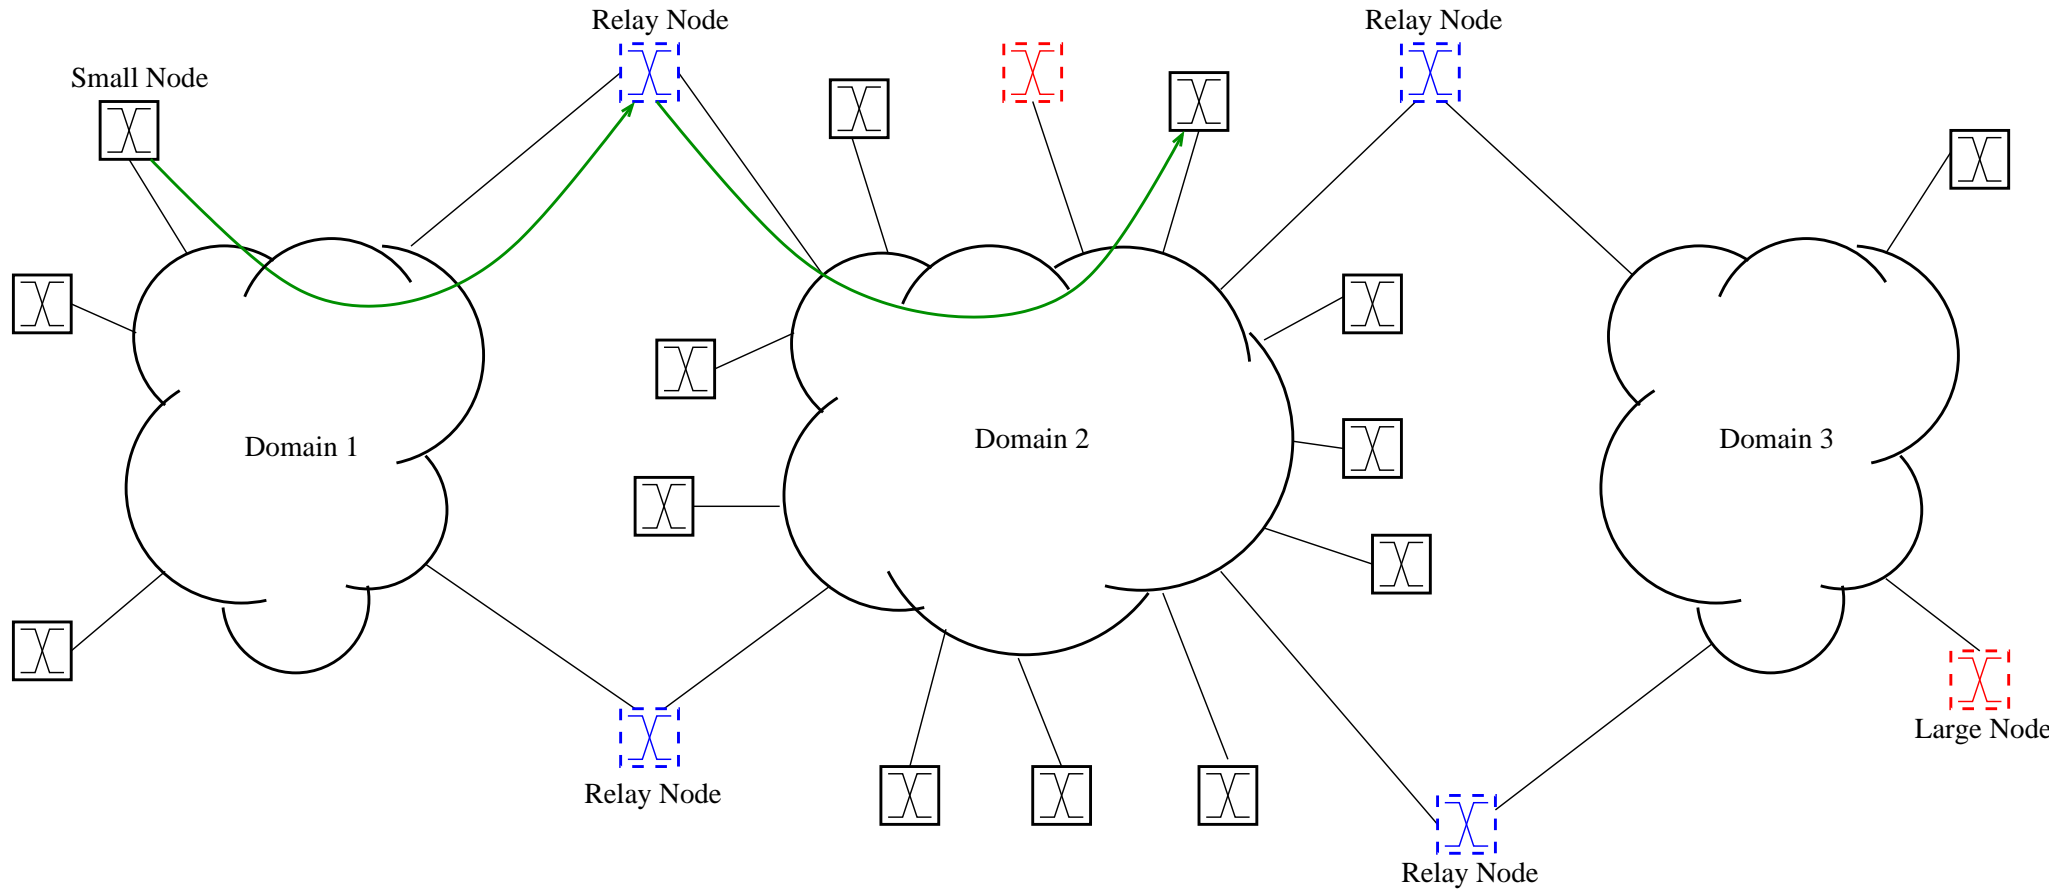

# Assumptions: Topology

- $M = 100$  users (end-devices)
- $D = 3$  domains
- $N = 20$  nodes ( $\leftrightarrow$  MEMS switches)
  - $N_L = 6$  large nodes (including  $N_R = 4$  relay nodes)
  - $N_S = 14$  small nodes
- Domains under different administrative control
  - lightpaths terminate at boundaries
  - end-to-end lightpaths  $\leftrightarrow$  intra-domain lightpaths
  - end-to-end lightpath consists of 1 – 3 intra-domain lightpaths

# Three-Domain Topology

# Three-Domain Topology

# Assumptions: Traffic

- Lightpath capacity: 10 Gbps
- Traffic distribution:
  - 40% Large-Large
  - 40% Large-Small
  - 20% Small-Small
- Traffic Pattern:
  - uniform
  - distance decreasing
  - distance increasing

# Simulation Scenarios

- Low traffic scenario
  - aggregate traffic: 5, 10, 100, 150, 200, 250, 300 Gbps
- High traffic scenario
  - aggregate traffic: 1.0, 1.5, 2.0, 2.5, 3.0 Tbps

# Topology Visualizations: Low Traffic, 100 Connections

Static topology: 141 LPs

ERON: 114 LPs

# Topology Visualizations: Low Traffic, 200 Connections

Static topology: 254 LPs

ERON: 143 LPs

# Topology Visualizations: Low Traffic, 300 Connections

Static topology: 376 LPs

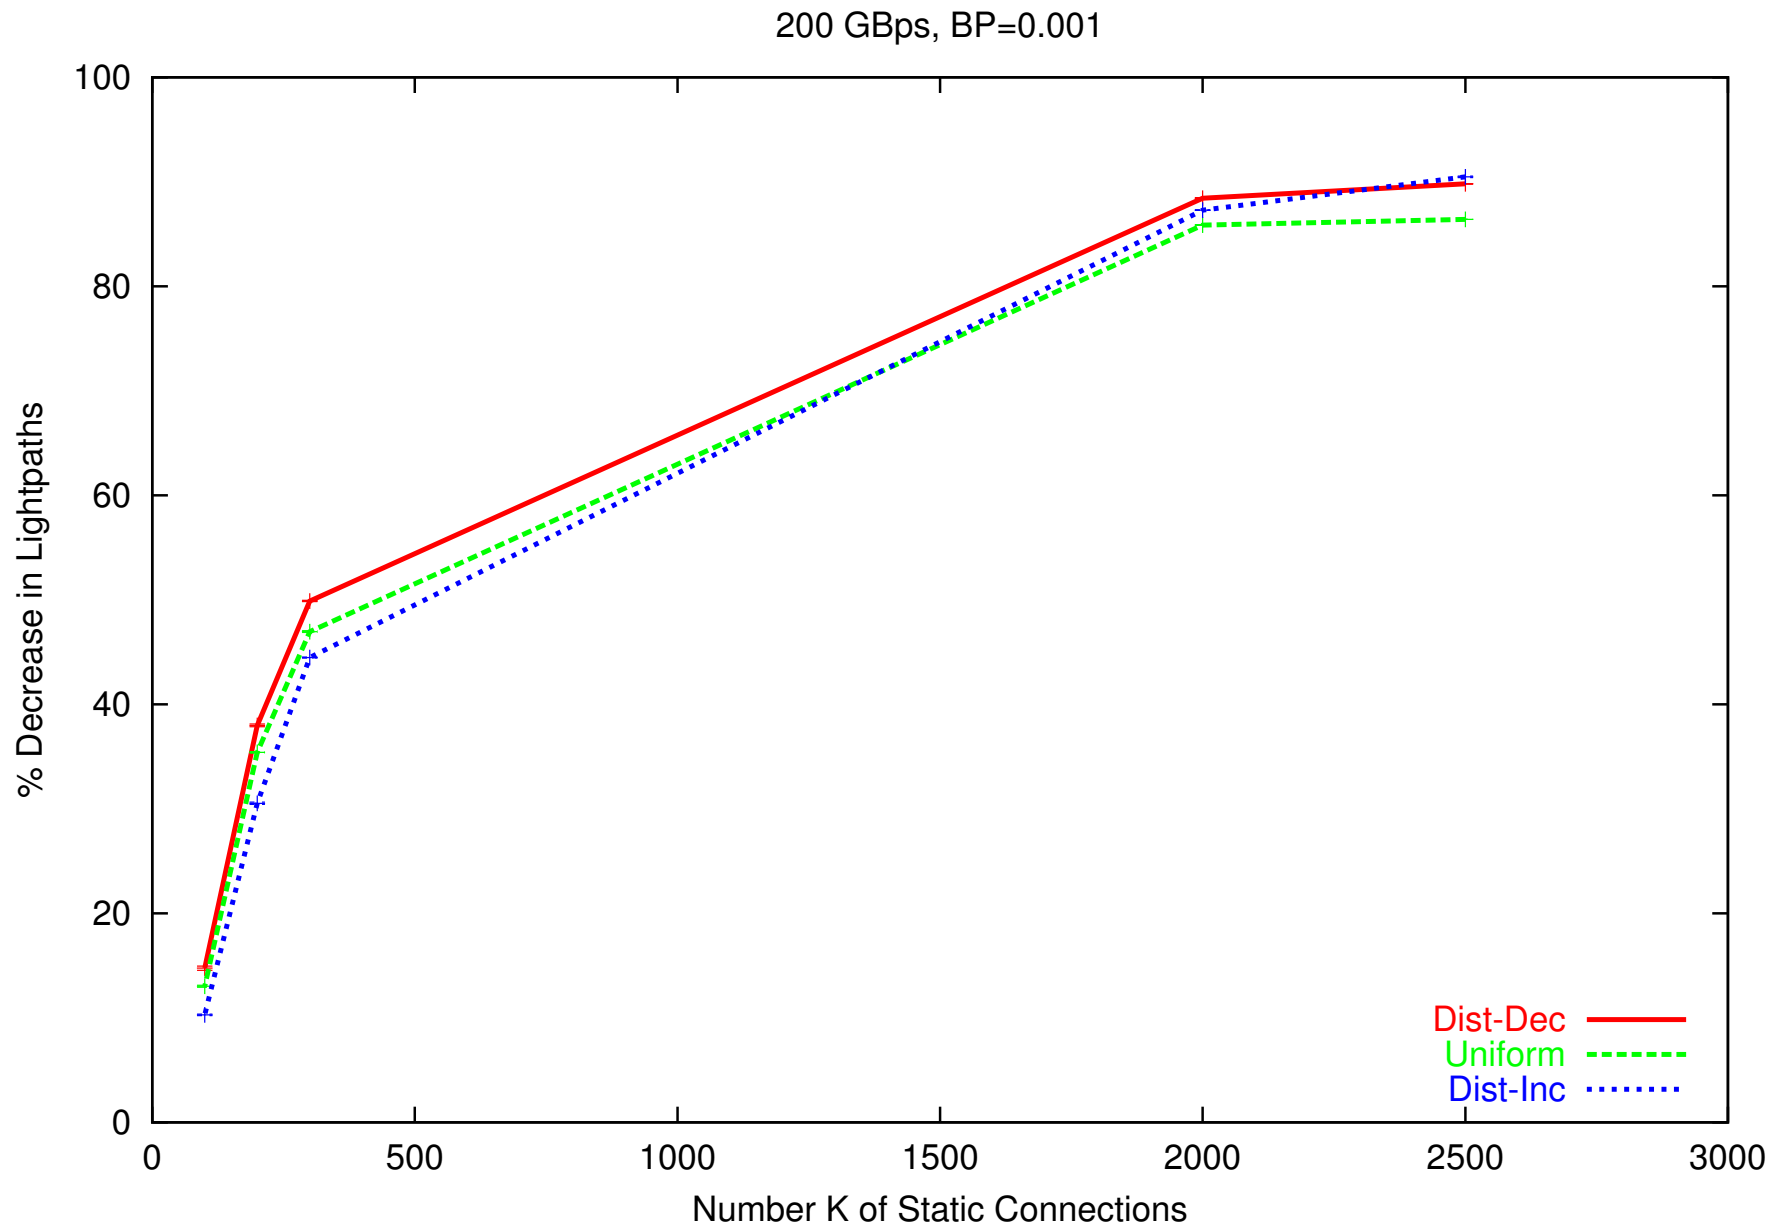

ERON: 173 LPs

# Low Traffic Scenario: Effect of Traffic Amount

# Low Traffic Scenario: Effect of # of Connections

# High Traffic Scenario: Effect of Traffic Amount

# High Traffic Scenario: Effect of # of Connections

# Summary

- ERON overlay control networks: medium-term solution
  - static topologies → ERON → reconfigurable core
- Easy to implement and deploy
  - use existing hardware and software technology
- Substantial benefits:
  - user-controlled dynamic optical networking
  - lightpath savings
  - sharing → higher utilization, “degree of connectivity”
  - low blocking
