Outline

- **Motivation:** Challenges with Internet Architecture
- **SILO:** A Meta-Design Framework
- **SILO as Research Tool:** Cross-Layer Experimentation
- Summary and Demo

In Search of Next Generation Internet

Challenges with Current Architecture

1. **Evolution:** function-heavy protocols with built-in assumptions
2. **High barrier to entry:** for new data transfer protocols
3. **Cross-layer design:** lack of inter-layer interactions/controls

Protocol Evolution: Transport

- Several distinct functions:
 - identify application endpoints (ports)
 - e2e congestion control
 - multi-homing (SCTP)
 - reliability semantics (TCP, RDP, SCTP, etc)

→ evolution of individual functions affects **entire** transport layer
- Lack of clear separation between policies and mechanisms
 - window-based flow control vs. how window size may change

→ prevents reuse of various components
- Built-in assumptions about IP addresses
 - transition to IPv6, support for mobility difficult

High Barrier to Entry

- New data transfer protocols difficult to implement/deploy
 - except for user-space
- Experimental network designs crucial for:
 - gaining insight
 - understanding protocol operation
 - discovering new knowledge rooted in physical world
- Implementations on commodity HW/SW remain challenging:
 - require modification of OS kernel
 - involve significant expertise
 - limit ability to “play” with network stack

Cross-Layer Design

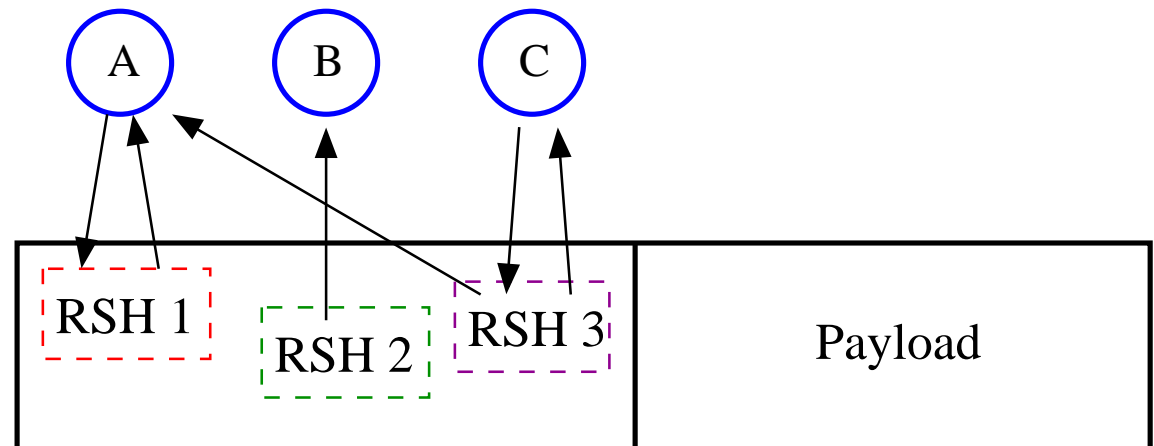

- Cross-layer design a major research theme over last decade:
 - wireless networks
 - TCP congestion control
 - optical networks (later)
 - . . .
- Adoption of ideas in operational networks quite slow:
 - no interfaces for inter-layer interactions/cross-layer controls
 - lack of experimental work
 - reliance on simulation with invalid assumptions

Accommodating New Functionality

- Deploy half-layer solutions (MPLS, IPSec)
 - layers become markers for vague functional boundaries
- Adapt existing implementation to new situations
 - TCP over wireless/large bw/delay product networks
- Implement own UDP-like data transfer
 - no reuse or kernel optimizations
- Abandon the old: new implementations for sensor networks
 - Internet balkanization

Role-Based Architecture (RBA) [BFH 2003]

- New abstraction: organize protocols in **heaps**, not stacks
- Richer interactions among protocols → flexibility
- Require new system-level implementations

Recursive Network Architecture (RNA) [TP 2008]

- **Meta-protocol:** generic protocol layer with basic services
- Each layer in stack → appropriately configured instantiation
- Allows reuse, cleaner cross-layer interactions, dynamic composition

Recursive Network Architecture (RNA) [TP 2008]

- **Meta-protocol:** generic protocol layer with basic services
- Each layer in stack → appropriately configured instantiation
- Allows reuse, cleaner cross-layer interactions, dynamic composition

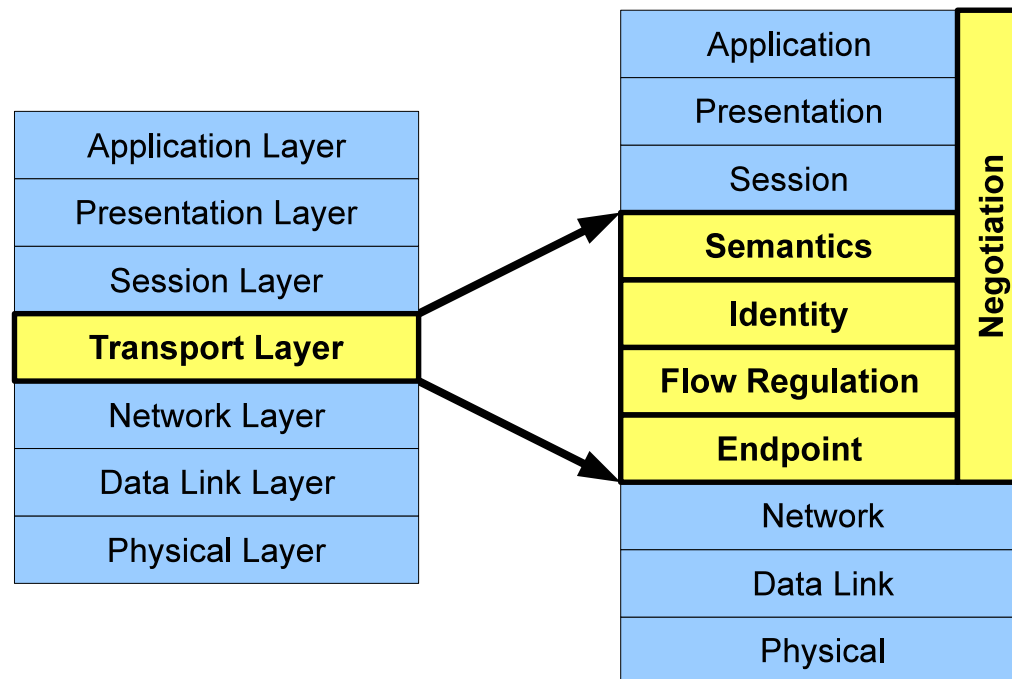

Recursive Network Architecture (RNA) [TP 2008]

- **Meta-protocol:** generic protocol layer with basic services
- Each layer in stack → appropriately configured instantiation
- Allows reuse, cleaner cross-layer interactions, dynamic composition

Tng – Transport Next-Generation [FI2009]

- Decomposes function-heavy transport layer
 - “true” e2e functions → reliable packet transport
 - “middlebox” functions → endpoint naming, congestion control
- Negotiation plane → cross-layer interactions

Layering As Optimization Decomposition

- Protocol layers integrated into mathematical framework
[CLCD 2007] [LSS 2006]
- Global optimization problem: network utility maximization
- Decomposition into subproblems → layering
 - optimal modules (protocols) map to different layers
 - interfaces between layers coordinate the subproblems

Layering As Optimization Decomposition

- Clean-state optimization → layered network architecture
 - optimal layering \neq TCP/IP stack
 - various representations of optimization problem
 - different layered architectures
 - (loose) coupling among layers → cross-layer considerations

Our View

- Internet architecture houses an effective design
- **But:** it is not itself effective in enabling evolution
- New architecture must be designed for **adaptability/evolvability**
- New architecture must **preserve/generalize** layering
- SILO objective: **design for change**

What is Architecture?

- Fundamental elements/principles **vs.** design decisions

What is Architecture?

- Fundamental elements/principles **vs.** design decisions
- **Diverse points of view** → FIND projects target: addressing, naming, routing, protocol architecture, security, management, economics, communication technologies (wireless, optical), . . .

What is Architecture?

- Fundamental elements/principles **vs.** design decisions
- **Diverse points of view** → FIND projects target: addressing, naming, routing, protocol architecture, security, management, economics, communication technologies (wireless, optical), . . .
- Our definition:

What is Architecture?

- Fundamental elements/principles *vs.* design decisions
- *Diverse points of view* → FIND projects target: addressing, naming, routing, protocol architecture, security, management, economics, communication technologies (wireless, optical), . . .
- Our definition:

it is precisely the characteristics of the system that does not change itself, but provides a framework within which the system design can change and evolve

Meta-Design Framework

- Obtain a meta-design that explicitly allows for future change
- **Not** a particular design or arrangement of specific features

Meta-Design Framework

- Obtain a meta-design that explicitly allows for future change
- **Not** a particular design or arrangement of specific features

The goal is not to design the “next” system, or the “best next” system, but rather a system that can sustain continuing change

SILO Architecture Highlights

- **Building Blocks:** services of fine-grain functionality
- **Design Principles:**
 1. Generalize traditional layer stack
 2. Enable inter-layer interactions:
 - **knobs:** explicit control interfaces
 3. Design for change:
 - facilitate introduction of new services
 4. Separate **control** from **data** functions

Generalization of Layering

- **Silo:** vertical composition of services
→ preserves layering principle
- **Per-flow** instantiation of silos
→ introduces flexibility and customization
- **Decoupling** of layers and services
→ services introduced at point in stack where necessary

Silos: Generalized Protocol Stacks

Inter-Layer Interactions (1)

- **Knobs:** explicit control interfaces
 - adjustable parameters specific to functionality of service
 - enable info exchange among services
- Algorithms may optimize jointly the behavior of services in a silo

Inter-Layer Interactions (2)

Upward information passing

Inter-Layer Interactions (2)

Downward information passing

Inter-Layer Interactions (2)

Up-and-down information passing

Inter-Layer Interactions (2)

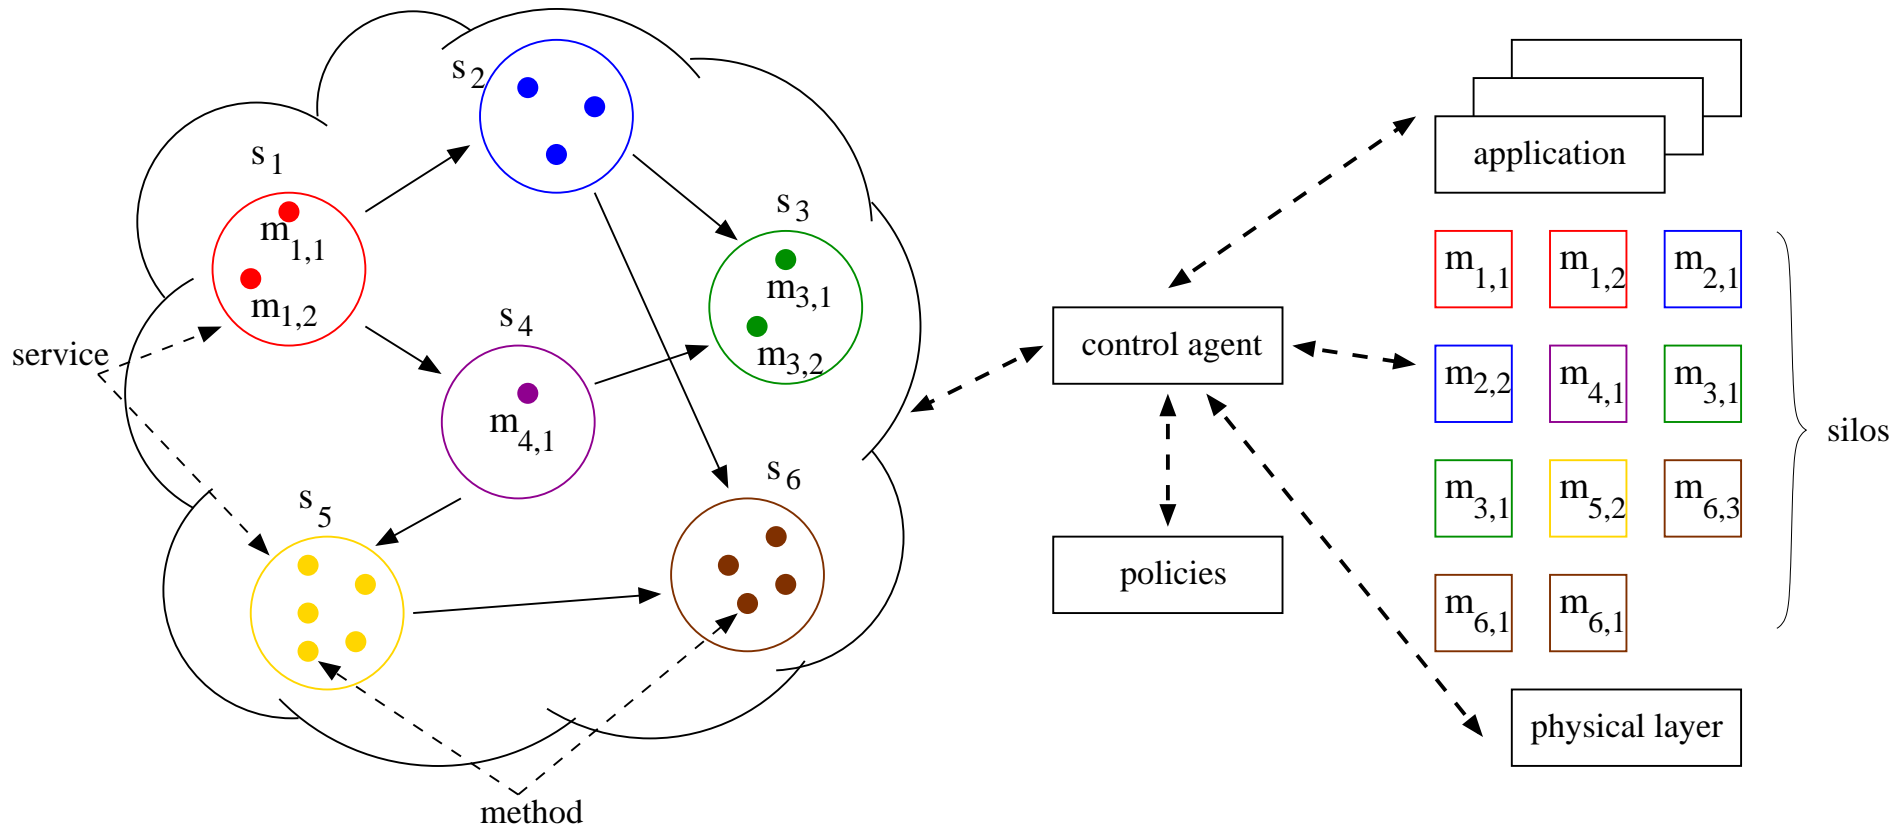

Silo-wide optimization/calibration

Design for Change

- Architecture **does not dictate** services to be implemented
- Provide mechanisms to:
 - introduce new services
 - compose services into silos
- **Ontology** of services: describes
 - service semantics → function, data/control interfaces
 - relationship among services → relative ordering constraints

Ontology – Networking Knowledge

Service Composition

- Constraints on composing services **A** and **B**:
 - A requires B
 - A forbids B
 - A must be above (below) B
 - A must be immediately above (below) B
 - Negations, AND, OR
- Minimal set:
 - Requires, Above, ImmAbove, NotImmAbove
- All pairwise condition sets realizable
 - Forbids = (A above B) AND (B above A)
 - Above = NOT Below

Service Composition Problem

- Given: a set of essential services ← application
- Obtain a valid ordering of these and additional services
 - or, identify conflicts with constraints
- Simple composition algorithm implemented
- Ongoing research in formalizing the problem

The SILO Hourglass

The SILO Hourglass

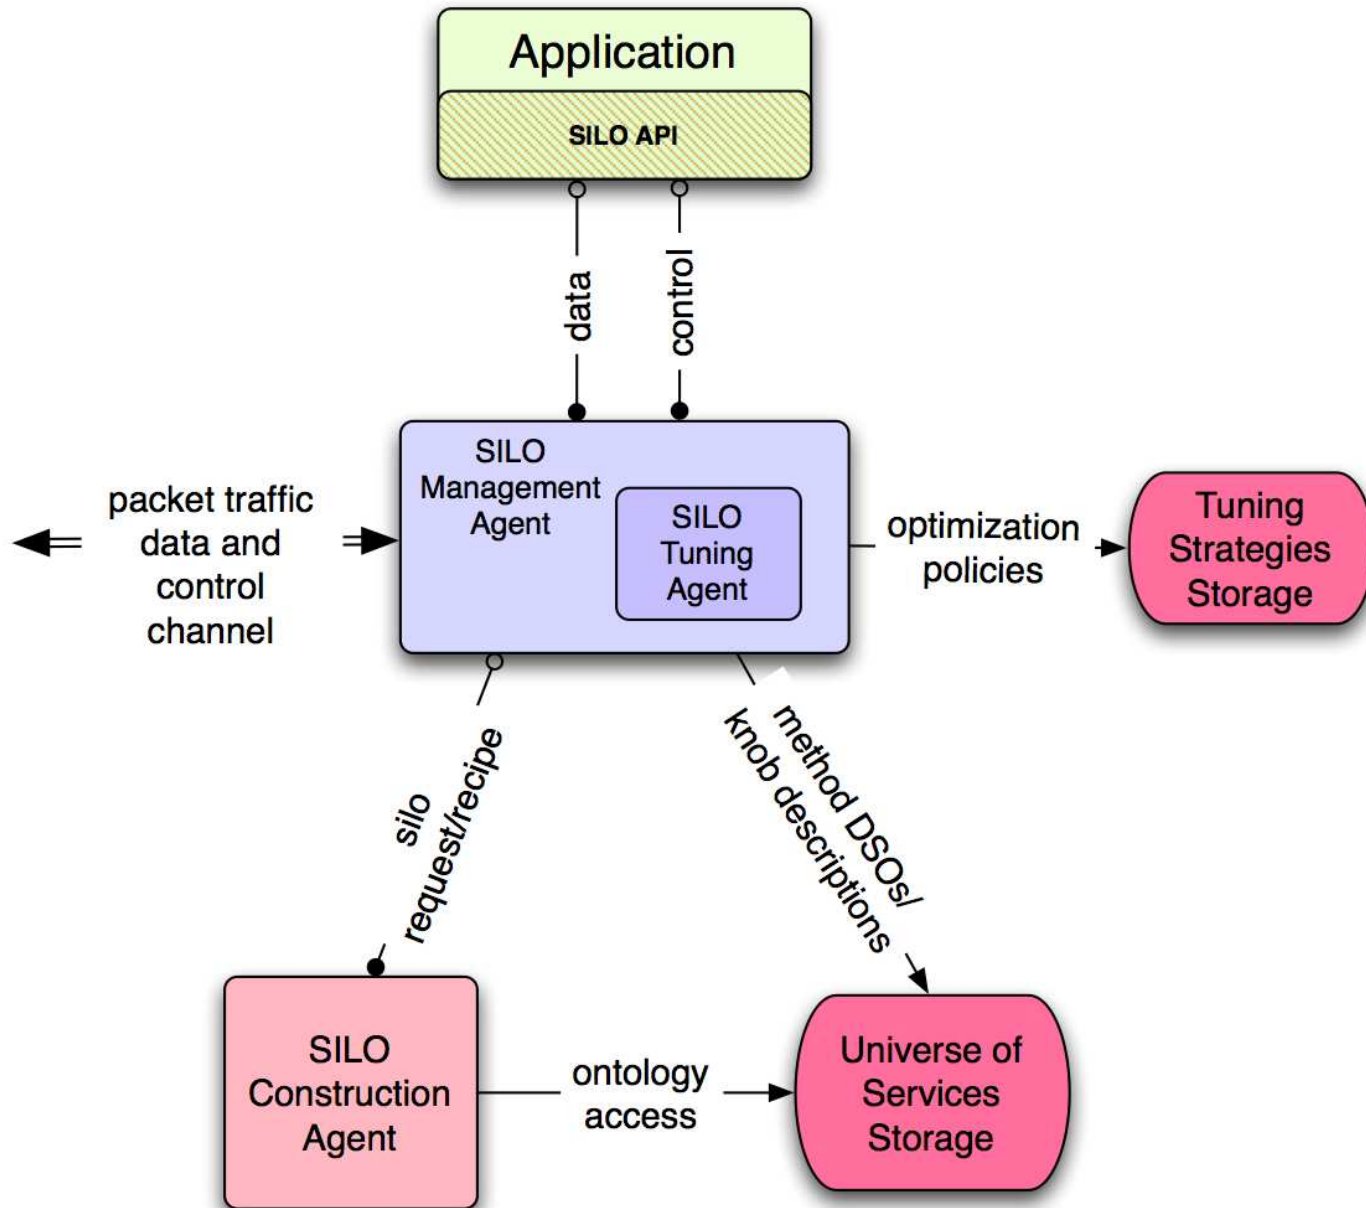

SILO Software Prototype

<http://net-silos.net/>

Prototype Architecture

SILO As a Research Tool

SILO As a Research Tool

- Deploys in a slice
- Researcher brings:
 - custom services
 - tuning algorithms
 - ontology updates
- Connect to measurement framework → cross-layer protocol experimentation tool

Software Defined Optics

- Optical substrate can no longer be viewed as [black box](#)

Software Defined Optics

- Optical substrate can no longer be viewed as **black box**
- Collection of **intelligent and programmable** resources:

Software Defined Optics

- Optical substrate can no longer be viewed as **black box**
- Collection of **intelligent and programmable** resources:
 - optical monitoring, sensing mechanisms
 - amplifiers, impairment compensation devices
 - tunable optical splitters
 - configurable add-drop
 - programmable mux-demux (e.g., adjust band size)
 - adjustable slot size
 - . . .

Cross-Layer Interactions

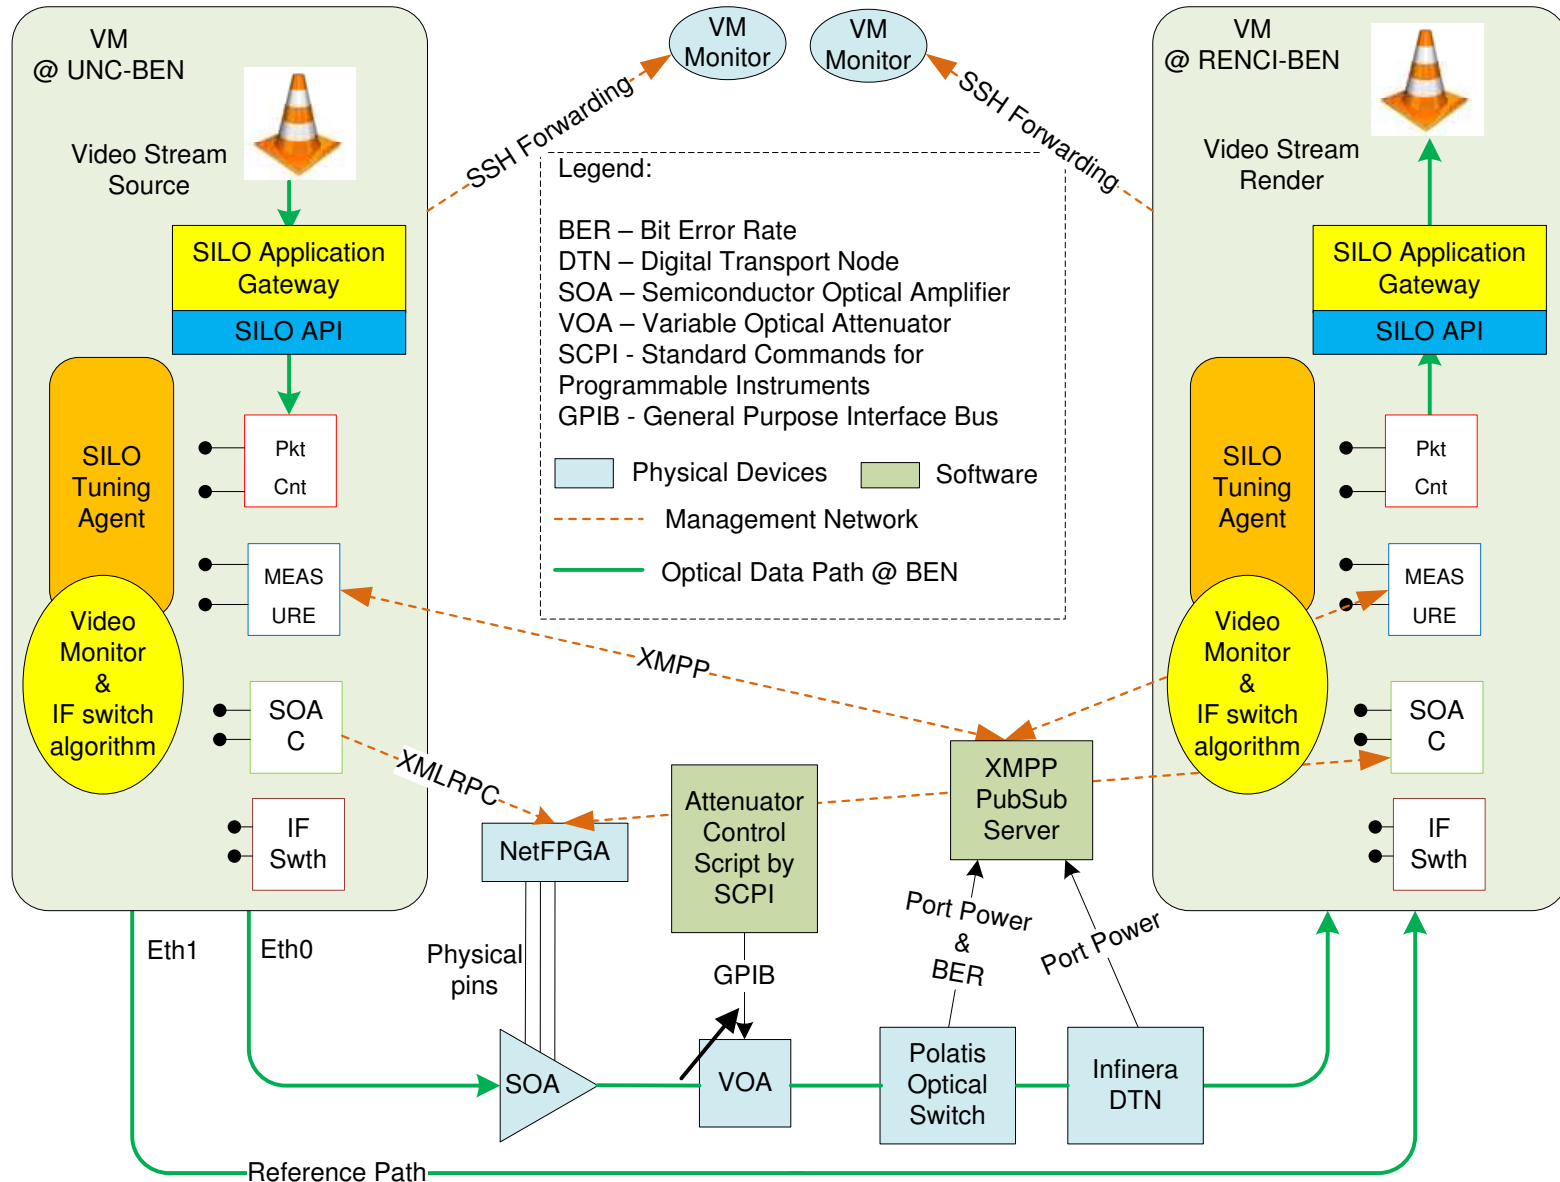

- Impairment-aware RWA and network design
- Placement of optical sub-systems (converters, amplifiers, regenerators)
- Traffic grooming
- Inter-layer QoS and traffic engineering
- Optical layer multicast
- Multi-layer failure localization and recovery
- ...

IMF Physical Infrastructure

IMF Cross-Service Demo

IMF Demo – Results

IMF Demo – Results

Summary

- Vision – enable flexibility, evolution: “design for change”
 - fine-grain, reusable services, explicit control interface
 - enables experimentation, flexibility, community of innovation
 - per-flow service composition (silos)
 - ease of evolution, policies
- Framework – provide architectural support to vision:
 - constrained composition
 - commoditize cross-layer interaction / optimization

Ongoing Efforts

- New research directions
 - silos in the core and scalability
 - policy enforcement through composition constraints
 - (generalized) virtualization as a service
- Extend the prototype
 - portfolio of reusable services
 - optical testbed deployment → breakable experimental net (BEN)

Upcoming Book
